The following document contains the codebook for each of the 13 datasets used in the article *Policy networks across political systems*. As per AJPS-guidelines, we do not report the full raw data, but only those variables used in the analysis. For the full raw data, please contact us.

As described in the article and the Supplementary Information Online, the data set consists of survey responses from policy actors in Switzerland, Germany, France and the Netherlands. Please refer to the article and the SI Online for information on how the data was collected.

1 attCH

The dataset has $N = 47$ rows and 18 columns. 33 rows have no missing values on any column. Table 1 reports the codebook for the ‘attCH’ data set. **source**, **endofpipe**, **prevent**, **wait**, and **eliminate** represent variables to assess policy core beliefs of respondents on how to handle micropollutants. **q1**, **q3**, **q4**, **q7**, **q8**, **q9**, **q10**, **q13**, **14** represent variables to assess instrument preferences of respondents on how to handle micropollutants. Table 2 shows summary statistics for all variables. Please refer to the SI Online for details on the survey.

Table 1: Codebook for dataset attCH.

Variable	Variable Definition	Value and Value Labels (s)	Source
actor	Actor identifiers, abbreviations only.		
actorTypes	Actor type classifications, numeric	1 national government (ministry, parliament, bureaucracy) 2 regional, local government, water authority 3 water association (drinking and wastewater) 4 environmental association 5 industrial, agricultural association 6 science 7 political party	
actorTypesChar	Actor type classifications, character		
source	Measures should address the sources of pollution.	4 strongly agrees 3 agrees somewhat 2 disagrees somewhat 1 strongly disagrees	
endofpipe	Measures should be end-of-pipe (waste-water treatment).	4 strongly agrees 3 agrees somewhat 2 disagrees somewhat 1 strongly disagrees	
prevent	Preventive measures should be taken to reduce potential risks for humans and the environment (precautionary principle).	4 strongly agrees 3 agrees somewhat 2 disagrees somewhat 1 strongly disagrees	
wait	It is reasonable to wait with policy measures until the impact of micropollution is fully understood.	4 strongly agrees 3 agrees somewhat 2 disagrees somewhat 1 strongly disagrees	
eliminate	Policy measures should aim at completely eliminating pharmaceutical micropollution in waters.	4 strongly agrees 3 agrees somewhat 2 disagrees somewhat 1 strongly disagrees	
q1	Bans or authorization restrictions of single pharmaceutical substances.	4 strongly agrees 3 agrees somewhat 2 disagrees somewhat 1 strongly disagrees	
q3	Discharge requirements for products containing pharmaceutical substances.	4 strongly agrees 3 agrees somewhat 2 disagrees somewhat 1 strongly disagrees	
q4	Use of best available technique (BAT) for the elimination of pharmaceutical micropollution (e.g. technically upgrading wastewater treatment plants, treatment of wastewater partial flows in companies or hospitals).	4 strongly agrees 3 agrees somewhat 2 disagrees somewhat 1 strongly disagrees	
q7	Definition of emission limits for micropollutants.	4 strongly agrees 3 agrees somewhat 2 disagrees somewhat 1 strongly disagrees	
q8	Product charge for pharmaceuticals.	4 strongly agrees 3 agrees somewhat 2 disagrees somewhat 1 strongly disagrees	
q9	Increase of the wastewater charge to fund measures for the reduction of pharmaceutical micropollution.	4 strongly agrees 3 agrees somewhat 2 disagrees somewhat 1 strongly disagrees	
q10	Subsidies (e.g. for investments in filtering technology or monitoring technology, optimization of production processes).	4 strongly agrees 3 agrees somewhat 2 disagrees somewhat 1 strongly disagrees	
q13	Information campaigns, consulting.	4 strongly agrees 3 agrees somewhat 2 disagrees somewhat 1 strongly disagrees	
q14	Research.	4 strongly agrees 3 agrees somewhat 2 disagrees somewhat 1 strongly disagrees	
reputation	Number of times other survey responders named focal organization as 'particularly important in the policy process' (exact wording: check all the actors that have been particularly important in the policy process from the point of view of your organization)

2 attDE

The dataset has $N = 29$ rows and 18 columns. 20 rows have no missing values on any column. Table 3 reports the codebook for the ‘attCH’ data set. **source**, **endofpipe**, **prevent**, **wait**, and **eliminate** represent variables to assess policy core beliefs of respondents on how to handle micropollutants. **q1**, **q3**, **q4**, **q7**, **q8**, **q9**, **q10**, **q13**, **q14** represent variables to assess instrument preferences of respondents on how to handle micropollutants. Table 4 shows summary statistics for all variables. Please refer to the SI Online for details on the survey.

Table 3: Codebook for dataset attDE.

Variable	Variable Definition	Value and Value Labels (s)	Source

5 collabCH

This dataset is an adjacency matrix for the Swiss policy network. The dataset has $N = 47$ rows and 47 columns. 47 rows have no missing values on any column. The rows and columns correspond to policy actors. Rows indicate sending actors, i.e., actors nominating other actors as collaboration partners. Columns indicate targeted actors, i.e., actors being nominated by another actor as a collaboration partner. Columns and rows are sorted in the same way as dataset attCH. Values in the adjacency matrix correspond to either 0 (for non-existing collaboration between two policy actors) and 1 (existing collaborations between two policy actors).

Table 9: Codebook for dataset collabCH.

[illegible]

6 collabDE

This dataset is an adjacency matrix for the German policy network. The dataset has $N = 29$ rows and 29 columns. 29 rows have no missing values on any column. The rows and columns correspond to policy actors. Rows indicate sending actors, i.e., actors nominating other actors as collaboration partners. Columns indicate targeted actors, i.e., actors being nominated by another actor as a collaboration partner. Columns and rows are sorted in the same way as dataset attDE. Values in the adjacency matrix correspond to either 0 (for non-existing collaboration between two policy actors) and 1 (existing collaborations between two policy actors).

7 collabFR

This dataset is an adjacency matrix for the French policy network. The dataset has $N = 18$ rows and 18 columns. 18 rows have no missing values on any column. The rows and columns correspond to policy actors. Rows indicate sending actors, i.e., actors nominating other actors as collaboration partners. Columns indicate targeted actors, i.e., actors being nominated by another actor as a collaboration partner. Columns and rows are sorted in the same way as dataset attFR. Values in the adjacency matrix correspond to either 0 (for non-existing collaboration between two policy actors) and 1 (existing collaborations between two policy actors).

8 collabNL

This dataset is an adjacency matrix for the Dutch policy network. The dataset has $N = 16$ rows and 16 columns. 16 rows have no missing values on any column. The rows and columns correspond to policy actors. Rows indicate sending actors, i.e., actors nominating other actors as collaboration partners. Columns indicate targeted actors, i.e., actors being nominated by another actor as a collaboration partner. Columns and rows are sorted in the same way as dataset attNL. Values in the adjacency matrix correspond to either 0 (for non-existing collaboration between two policy actors) and 1 (existing collaborations between two policy actors).

9 indegAll

The dataset has $N = 149$ rows and 3 columns. 149 rows have no missing values on any column.

Table 13: Codebook for dataset indegAll.

Variable	Variable Definition	Value and Value Labels (s)	Source
indeg	Indegree centrality of policy actors.		
missing	Dummy variable indicating which policy actors did not respond to the survey or follow-up emails/calls.	0 survey responder 1 non-responder	
country	Character indicating which country the policy actor is from.		

Table 14: Summary statistics for dataset indegAll.

name	data_type	n_missing	n_unique	min	max	mean	sd
indeg	numeric	0	17	0	38	4.66	4.45
missing	numeric	0	2	0	1	0.26	0.44
country	character	0	4	France	Switzerland		

10 oppCH

This dataset is an adjacency matrix with opponents in the Swiss policy network. The dataset has $N = 47$ rows and 47 columns. 47 rows have no missing values on any column. The rows and columns correspond to policy actors. Rows indicate sending actors, i.e., actors naming other actors as opponents/having divergences about the policy content. Columns indicate targeted actors, i.e., actors being nominated by another actor as an opponent. Columns and rows are sorted in the same way as dataset attCH. Values in the adjacency matrix correspond to either 0 (for non-mentions of divergences) and 1 (existing divergences between two policy actors).

11 oppDE

This dataset is an adjacency matrix with opponents in the German policy network. The dataset has $N = 29$ rows and 29 columns. 29 rows have no missing values on any column. The rows and columns correspond to policy actors. Rows indicate sending actors, i.e., actors naming other actors as opponents/having divergences about the policy content. Columns indicate targeted actors, i.e., actors being nominated by another actor as an opponent. Columns and rows are sorted in the same way as dataset attDE. Values in the adjacency matrix correspond to either 0 (for non-mentions of divergences) and 1 (existing divergences between two policy actors).

Table 16: Codebook for dataset oppDE.

Variable	Variable Definition	Value and Value Labels (s)	Source

12 oppFR

This dataset is an adjacency matrix with opponents in the French policy network. The dataset has $N = 18$ rows and 18 columns. 18 rows have no missing values on any column. The rows and columns correspond to policy actors. Rows indicate sending actors, i.e., actors naming other actors as opponents/having divergences about the policy content. Columns indicate targeted actors, i.e., actors being nominated by another actor as an opponent. Columns and rows are sorted in the same way as dataset `attFR`. Values in the adjacency matrix correspond to either 0 (for non-mentions of divergences) and 1 (existing divergences between two policy actors).

13 oppNL

This dataset is an adjacency matrix with opponents in the Dutch policy network. The dataset has $N = 16$ rows and 16 columns. 16 rows have no missing values on any column. The rows and columns correspond to policy actors. Rows indicate sending actors, i.e., actors naming other actors as opponents/having divergences about the policy content. Columns indicate targeted actors, i.e., actors being nominated by another actor as an opponent. Columns and rows are sorted in the same way as dataset `attNL`. Values in the adjacency matrix correspond to either 0 (for non-mentions of divergences) and 1 (existing divergences between two policy actors).
